Category: [Laser Cutter News](#)

There are more and more [laser cutting machine](#) equipment, and there are more and more manufacturers, but the prices of each manufacturer are uneven. Where is the gap? Let's take a look today.

1. Power: The metal sheets used in different industries have different thicknesses, and different laser powers are required to cut different sheet thicknesses. The higher the laser power, the thicker the cut plate, and the higher the price, so choose the appropriate power according to your own actual processing thickness. Don't buy low power because the price is low and the cutting thickness cannot be reached, and don't listen to others. High power is good and overkill;
2. Models: At present, there are roughly several models of laser cutting in the market, such as single-table, double-platform, protective cover, integrated plate and tube, and automatic feeding device. This is considered according to the sheet metal specifications and processing volume to be processed. Of course, the more devices you bring, the higher the price;
3. Configuration: Many customers who have learned about laser cutting machines will ask some configuration questions when consulting equipment. The quality of configuration affects the quality of cutting, so configuration is a problem that many customers are very concerned about;
4. Service: The laser cutting machine is a device that can be used for a long time. All mechanical equipment, including household appliances, will have some minor problems after a long time of use, let alone large-scale equipment. Therefore, after-sales service is also a matter of great concern to customers. Solving customers' problems in a timely and efficient manner after sales can also make customers feel at ease when using the equipment.

There are many factors that affect the price, and you should choose according to your actual needs.
