Many people are used to asking "how much is a [laser cutting machine](#)?" when they consult a laser cutting machine, just like someone asking you "how much is a mobile phone?", you can't give them an accurate number. Many people also feel that the prices are uneven, and they are at a loss. So what price is reasonable?

Clarify your needs

You must first clarify your needs, what material to cut, and the specifications of the material to be cut. Like the current mobile phones, some are good at taking pictures, some are good at playing games, some are good at business, etc., each is different, we have to choose according to our own needs, and the same is true for choosing a laser cutting machine;

Secondly, some laser cutting machines are equipped with an exchange platform, which can save processing time; some are equipped with protective covers to reduce laser radiation and smoke pollution, which is more environmentally friendly and safe; there are also laser cutting machines with integrated plates and tubes, which can process both pipes and plates; however, the more functions a laser cutting machine has, the higher the price.

Models that suit your needs

After clarifying our needs, we have to choose the model. Just like mobile phones, there are X, Pro, and Plus. There are also many types of laser cutting machines. According to the size of the plate you need to cut, there are 3015, 4020, and 6025. According to the thickness of the cutting material, there are 1000W, 3000W, and 8000W power.

The next step is the configuration of the main equipment. Different configurations lead to different processing accuracy, stability, and service life.

After-sales issues

The price of a piece of equipment is not only the equipment itself, but also the after-sales service. After all, the laser cutting machine is a long-term processing and use equipment. It needs constant

maintenance during use, and occasionally there will be some places that need to be repaired. Therefore, a good after-sales service is also very important for customers to buy the machine with peace of mind.

Therefore, if you want to buy a satisfactory device, you should not only focus on the price, but also see what the price can bring you and whether it really meets your real needs. If you want a high-end equipment, the price must be higher. Don't blindly pursue the price and ignore the quality.
