Category: [Laser Cutter News](#)

Laser engraving machines are processed by high temperature melting. The power of the laser engraving machine varies from large to small, and the purchased power needs to be determined according to the material and thickness to be cut. Some people say that the laser engraving machine processing is not ideal, the edge is burnt, and the cut surface is not neat. Generally, a reasonably designed laser engraving machine does not have such a problem under normal use. Before the laser engraving machine is used, it needs to be debugged, and the debugged equipment can cut the ideal effect. In addition, maintenance measures should be taken for the laser engraving machine in the later stage, otherwise the wear and tear of the accessories will also affect the processing effect of the equipment

1. Try not to look directly at the laser.
2. Do not put your hands on the table, and keep a certain safe distance between your body and the equipment.
3. Unrelated personnel should not approach the running laser engraving machine.
4. Be careful not to place irrelevant things on the laser engraving machine, so as not to cause an open flame when the shock falls on the table.

The ventilation equipment needs to be turned on during the laser engraving machine processing, this is clear. The operation of the laser engraving machine should focus on safety to ensure safe production. Operators who operate laser engraving machines need to be trained in advance, and they can only work after passing the examination. Operators need to strictly abide by the relevant rules and regulations. Is it clear to everyone?
