Category: [Laser Cutter News](#)

When buying a [laser cutting machine](#), many customers may pay more attention to the price of the laser cutting machine, operating skills, how to achieve the ideal cutting effect, etc., and often ignore the precautions before using the new equipment. Let me explain how to use the laser cutting machine better.

1. Acceptance: first check whether it is the equipment you choose to purchase, whether the equipment is damaged during transportation, and whether the relevant parts and accessories of the equipment are complete and damaged. If there are transportation damages, inconsistent laser cutting machine models, missing parts, etc., you need to contact the after-sales service for verification.
2. Laser cutting machine location and installation requirements: Choose a place that is dry, avoids humidity, well ventilated, and has enough space to place the equipment. In order to ensure the cutting quality, it needs to be away from vibration.
3. Equipment debugging: The manufacturer will debug the relevant parameters of the newly purchased equipment, but the transportation needs to disassemble the equipment again and the road is bumpy. After arriving at the destination, the equipment needs to be reinstalled and debugged.
4. After-sales training: After the equipment arrives, professional after-sales engineers will provide training on equipment operation, such as: equipment installation, parameter adjustment, daily maintenance and other related precautions.

If the equipment breaks down during use, you need to contact the manufacturer as soon as possible. Do not deal with uncertain issues by yourself to avoid secondary damage to the equipment.
